Tired of Wasting Time & Money?

Microsoft Small Business Server

Start managing your data & communications!

For most small businesses, every dime is important. That's why a lot of companies will delay putting in a network for as long as they can – they figure they can save some money if they are able to run their computers without one. What they forget to factor in are those sneaky "soft costs". And don't be fooled – they can be huge!

There's a lot of downtime that results from systems that aren't properly managed – not to mention the potential loss of critical data, which is, alarmingly, the cause of failure for a lot of businesses! A properly managed network can prevent all of these hidden expenses. You'll see just how quickly a network can pay for itself when all of these factors are added up.

Improved Productivity. Easily share files – both in the office and remotely – instead of wasting time transferring them back and forth. Also, communication amongst employees and with customers is made a lot easier with the built-in Exchange email server and scheduling tools.

File Protection. Automatic data backups ensure that critical files are not lost in the case of system failure. No one understands how important this is until it happens to them!

Prevents Crashes & Security Breaches. A more stable platform means your systems are less likely to fail; avoids costly downtime. And built-in firewall protection prevents access to your data by outside intruders.

Lower Equipment Costs. A single printer, fax and internet connection can be accessed quickly and easily by everyone in the company directly from their own computer. Start adding up how much all of that additional equipment and downtime will cost over time!

Today, as we have become more and more data-driven, networks have become a necessity even for small businesses. To meet this growing need, smaller scale networks have been designed exclusively for your market. The MS Small Business Server provides you with a small, stable network that gives you the structure and expandability you will need as your business grows: SBS starts with as few as 5 users and expands up to 75. It offers most of the same benefits as larger corporate networks, but doesn't come with a corporate price tag.
Still not convinced? Here are some stats, based on surveys of SBS customers, indicating their savings, both in time and money: average ROI was 947%; payback of hardware & software costs were realized in a matter of months; companies increased their revenues with improved customer responsiveness; and they found that they worked more productively & efficiently. On top of that, many even reported an improved quality of life!

You were brave enough to start your own business, and had the vision to get it to where it is today…now it's time to take the next step toward building its future. Latest Developments specializes in implementing network systems for small business. Give us a call to help you keep your company growing in the right direction!
